

PTR HARTMANN

A Phoenix Mecano Company

TESTING TECHNOLOGY

Quality Down to the Tiniest Detail

PTR HARTMANN
A Phoenix Mecano Company

WE COMBINE
PRECISION, INNOVATION
AND RELIABILITY
FOR YOUR BENEFIT.

PTR HARTMANN is responding to the globalisation of markets with an expanded distribution network. In over 60 locations worldwide, qualified personnel ensure that our products and services are always available to customers.

Areas of Operation

- Testing Technology
- Connection Technology
- Inductivities
- Switches
- DIN Rail Terminal Blocks

INTRODUCTION

Good functionality, a high level of efficiency, excellent precision and absolute reliability in our delivery performance:

these factors are why customers worldwide are putting their faith in PTR HARTMANN products. We combine quality and reliability with the claim to provide optimal solutions for customer-specific requirements. For us, these features have a long tradition. Since 1979, alongside a constantly expanding range of products, they have played a major role in our becoming a modern global player in the electromechanical components sector. Today, the name of PTR stands for excellence and innovation in the field of terminal and testing technology. Our merger with the Swiss firm of Phoenix Mecano in 1989 strengthened our worldwide presence. As a result, PTR HARTMANN terminal blocks, multi-connectors, test probes and DIN rail terminal blocks are now available in more than 50 countries.

In addition, we set standards by using German engineering, high-quality materials, flexible production processes and intelligent logistics.

Also, the areas of application for our test probes are extremely wide-ranging. In the sectors of telecommunications, medical technology, aeronautics and aerospace, the automotive industry and many others, PTR test probes are used as secure and reliable contact elements for testing PCBs (ICT+FT) and cable harnesses. One additional and steadily growing field of applications is the use of test probes as a charging contact for industrial applications or PCB connectors as a single contact or multi-pole contact block.

PTR responds to the constantly increasing demands of the market by presenting flexible and targeted solutions. The development and construction of connection technology for customer-oriented applications lead to permanent on-going development of our range of products. In these cases, professional concepts are developed jointly and implemented precisely in cooperation with our customers.

As a result of its work in the components sector, PTR has also acquired a great deal of competence and excellent know-how about plastic parts. All this experience has been used to develop a new range of products, and for some time interface blocks have added to and expanded this. They are used wherever rechargeable batteries in mobile devices such as scanners, card

readers, communication devices and others need to be recharged. One example is e-bikes, in which the battery connections are used in the operating unit and the display. In addition they are found in LED lights in the shopfitting sector and for "smart home" solutions. Also, they are often used to connect two PCBs, and for both purposes they can be supplied, ready for use, in blister belts and trays.

For us, on-going development of our products, in line with market requirements, is both a task and an obligation.

The result is new applications for different test technology applications. Without doubt, one highlight is the wide range of high-frequency test probes used in the growing market for communication and in-car entertainment technology. Our HPL test probes were developed to deal with the special demands which the PCB test requires. The high level of spring pre-tension and the resulting high initial pressure lead to a reduction in pseudo errors in the ICT sector.

A company which offers first-class products and services cannot leave anything to chance, so the use of modern quality management systems is very important. In order to implement and achieve the above-mentioned goals, it is especially important for us to continue to expand these concepts of quality and to anchor them in a quality management system. To this end, the group and company management have decided to introduce a QM system according to EN ISO 9001 so that we can continue to satisfy both the high levels of market requirements and those of our customers.

Success also means responsibility.

PTR sees the relationship to the environment and the preservation of our habitat for future generations as an obligation. We document this with certification according to EN ISO 14001. Of course, we also comply with EU directives such as ROHS2 (2011/65/EU) and REACH (1907/2006/EC) in their current versions.

All the information in this catalogue has been compiled to the best of our knowledge and belief and is correct at the time of going to print. Up-to-date information is always available on our PTR HARTMANN website at www.ptr-hartmann.com.

PHOENIX MECANO AG

The Group Phoenix Mecano is a global player in the enclosures and industrial components segments, has a streamlined operating structure and is a leader in many markets. Geared towards the professional and cost-effective manufacture of niche products, it helps to ensure the smooth operation of processes and connections in the machine industry and industrial electronics. Its products are used in the mechanical engineering, measurement and control technology, alternative energy, medical technology, aerospace technology and home and hospital care sectors, amongst others.

Enclosures

Phoenix Mecano enclosures protect all types of electronic and electrical equipment, offering exactly the kind of protection the customer requires.

Areas of application include plant engineering, railway, automotive and medical technology and offshore oil platforms. In addition to enclosures, Phoenix Mecano also supplies input units such as membrane keyboards and keypads, short-stroke keys, capacitive buttons and touchscreens.

Mechanical Components

This division's wide range of linear actuators, electric cylinders and lifting columns are deployed in industry, workstation installation and the home and hospital care sector.

Its profile assembly systems can be used to assemble peripheral production systems right through to entire production lines.

ELCOM/EMS

The ELCOM/EMS division's products are used wherever electrical energy flows, whether it be high, medium or low voltage, alternating or direct current.

They can be found in all industrial sectors, from medical technology, astrophysics and aerospace, to power distribution networks, switchgear and renewable energy.

Design and Structure

Application Areas

Test Probes are used in the manufacture of electronic products to test PCBs. When fitted in test adapters, they carry out in-circuit tests and function tests. The aim is to optimize production by raising quality and reducing costs, factors which are caused by faulty components.

The test probe also plays an important part in the automotive industry, where it is used in test modules for testing connectors in cable harnesses. This means that the test probe is an important link in meeting the high quality standards found in automobile manufacture.

Interface Pin Blocks create an electrical contact between two components. As battery probes, they are used, for example, wherever it is necessary to charge the rechargeable batteries in mobile devices such as scanners, card readers, communication devices, etc.

The special design of the test probes which are used here adapts perfectly to an extremely wide range of contact situations. The probes guarantee a clean connection on almost all surfaces, including with ambient conditions in which oscillations and vibrations could affect the contacting. Irrespective of the specified installation height of the interface pin blocks, the test probes compensate for unevenness and differing heights on the contact surfaces. These features ensure a perfect and safe electrical contact. When positioned in the right place and used correctly, the interface pins can achieve up to 1 million contact cycles.

One typical application for interface pins is their use in interface pin blocks. They can be used for the secure connection of two PCBs which, by means of flexible contacting technology, can be connected and disconnected as often as required. This especially flexible connection of the interface pin blocks requires only a contact surface which is larger than the diameter of the probe head, so it offers considerable advantages when compared with connectors, which always require a precise connection. Additional arguments in favour of the use of interface pin blocks include the absence of insertion and withdrawal forces, and minimal wear and tear.

Design

In its basic construction, a test probe consists of three parts (see fig. 1). The electrical contact to the test piece is created by the plunger, which, together with a spring, is inside the barrel. The individual parts are connected moveably with each other by means of mechanical re-shaping of the barrel..

Barrel

The barrel protects the moving parts. At the same time, small tolerances ensure precise plunger guidance. The barrels are manufactured using deep drawing or machining processes. In some cases, ventilation drill holes are needed to ensure optimal coating.

Plunger

The plunger must conform to very high standards. It is a moving part which must be low-wear but at the same time highly conductive. Close tolerances must be included in the above criteria when plungers are used for small centers. The plungers are manufactured with maximum precision on long-turning lathes and then refined. In most cases, the plunger is coated with gold.

Plungers are manufactured of hardened fine-grained steel for use in heavy-duty operating time situations. The emphasis is on tips with extra penetration, for example pointed tips. Aged copper-beryllium (CuBe) is used for plungers, especially when high demands are made of electrical conductivity for longterm constancy. With regard to environmental aspects, these are taken care of by the 100% wet-processing of the beryllium and by the coating on the plungers.

Test probes with CuBe plungers are suitable for measurement tasks in the case of potential difference and for high-voltage applications. The brass plunger design with equally good conductivity is suitable for low-wear applications, e.g. charging contacts with very short travel and non-aggressive tip styles.

Alternatively, the plungers are fitted with different improvement coatings which, in addition to the electrical conducting and contact characteristics, are intended to satisfy specific requirements in respect of abrasion resistance and corrosion protection.

Spring

For the most part, springs are manufactured of spring steel wire of the maximum strength category with a special surface finish. The working temperature range for these springs between -30°C and +120°C also determines the operating temperature range for the complete spring contact probes. High-strength stainless steel wire is used with higher temperatures up to +250°C and increased demands on corrosion protection.

However, with this wire, it is not possible to achieve such high strength or spring force values as with spring steel wire.

Normally, gold is used as a surface plating because it reduces wear and improves the contact characteristics. The coating is applied in such a way that the structural characteristics of the high-strength spring material are affected as little as possible. In special cases, the springs are silver-coated (improved conductivity). In most cases, stainless steel springs are not given an additional coating, and they are used when temperatures are very high or for maximum heating.

The rated spring force of the spring contact probes refers to the working travel, which, as a rule, is 4/5ths of the maximum permitted plunger stroke travel.

Fig. 1:
Test Probe Design

Materials and Coatings

MATERIALS

Steel

PTR uses steel as the standard material for the plungers. The stability of this material is good in comparison with others, and is extremely suitable for aggressive probe tips such as the “pointed tip” or the “chisel”. The electrical properties are improved by the preferred gold coating.

Copper Beryllium

Copper beryllium is superior to steel in respect of the long-term stability of the electrical properties. Adding beryllium allows the materials to be easily processed, without completely losing the excellent properties of the copper.

Brass

Brass is a relatively soft material which is good for manufacturing purposes. Because of the high copper content, the electrical properties are also good, and for this reason, the material is mainly used for receptacles and barrels. However, brass is also a very popular plunger material for battery charging contacts, which normally do not have to withstand a very high number of load cycles.

Bronze

Bronze is used as a base material for receptacles and barrels; it offers good electrical properties and can be both turned and deep drawn.

Nickel Silver

Nickel silver is a very interesting material for receptacles because it is especially corrosion-proof and can be manufactured using the deep drawing process. Its copper content also makes it an acceptable conductor.

Spring Steel

High-strength spring steel is what is normally used to manufacture springs. It provides excellent properties which permit the manufacture of test probes with long operating times and balanced forces. The temperature range is from -30°C to 120°C. The springs are coated with gold or silver.

Stainless Steel

Stainless steel is used for springs in situations which require greater temperature stability than those which require standard springs. Temperatures from -40°C to 250°C (max. period of one hour) are possible. Good corrosion resistance is an additional advantage of stainless steel.

Plastic

High-quality plastics which can resist high temperatures are used to isolate the probe tip of switching test probes or as an isolator in the test probe itself. This material is also used as a carrier material for interface pin blocks. This is where PTR can benefit from its extensive experience of the terminal block sector.

COATINGS

In all cases an intermediate nickel coating is used for protection in order to prevent diffusion of the material.

Hard Gold

Hard gold has a passive surface, so it is an ideal electrical contact partner with very good chemical resistance. The special gold alloy, with a micro hardness of up to 400 HV, is much harder than pure gold, but there are limits with regard to wear behaviour. The abrasion behaviour can be influenced positively if the conditions of use are optimised, for example by the avoidance of radial movements.

Rhodium

Rhodium is one of the platinum metals. A very high level of wear resistance is achieved because of the very high degree of hardness of up to 1000 HV. However, because of the stored oxygen, a higher level of layer brittleness must be expected. This problem can be reduced by means of a special layer build-up and reduced layer thicknesses. However, rhodium plating is unsuitable when heavy impact loads are involved. If the brittle and very thin rhodium layer is damaged, this may have a negative effect on the initially good electrical contact characteristics.

Nickel (chemical)

Nickel is distinguished by even layer deposition with excellent contour accuracy, which is especially advantageous for the function of pointed tips and sharp-edged tip styles. This nickel-plating has a micro hardness of approx. 600 HV, which can, as an option, be increased to 1000 HV and more by means of subsequent heat treatment. This is accompanied by very good wear resistance. Maximum corrosion resistance is achieved by the intercalation of phosphorus. However, the resulting inactive surface does not result in such good contacts as those of gold or rhodium.

Silver

Silver provides the best electrical conductivity among metals, which is why it is used, for example, for high-current applications. In this case, the spring of the test probe used is silver-coated in order to increase conductivity. In addition, some of the probe tips in the high-current range are fitted with caps made of a silver alloy, because this prevents restrictions to the conductivity caused by contact pitting.

Receptacles and Assembly

RECEPTACLES

Receptacles are fitted firmly in the relevant probe location boards in order to permit the replacement of the spring contacts without wiring work when the limit to the operating life (see page 20) is reached.

Base materials for the receptacles are

- » Bronze
- » Nickel Silver or
- » Brass

Gold plating ensures good electrical properties, with nickel underneath for corrosion protection.

Types of Receptacles

PTR HARTMANN offers receptacles with a range of connection types. In addition to standard products such as crimp, solder and wire wrap connections (see fig. 1), solutions for special fields of application are available.

Threaded Receptacles for screwable Test Probes (see fig. 2)

This type of receptacle is used in so-called test benches which test the functionality of cable harnesses. The screwing of the test probes into the receptacle prevents unintended twisting of the test probes out of the receptacle caused by the abrupt stroke movements of the test modules.

Threaded Receptacles with a drill hole in the solder cup (see fig. 2)

This receptacle is sealed vacuum-tight when the wire is soldered on.

Easy Replacement Receptacles for Switching Test Probes (see fig. 2)

In this case, wiring takes place twice on the receptacle and no longer on the switching test probe itself. During maintenance work, the switching test probe can be replaced without the need for any other wiring work.

Receptacles with a non-rotating feature (see fig. 2)

This type of receptacle makes it possible to position the test probes precisely in respect of the test piece. This solution is used especially with the so-called spade-shaped head style.

Insulation Receptacles (see fig. 2)

This type of receptacle is deployed when test probes are used in a conductive carrier material. In this case, the insulation receptacle holds the actual receptacle of the test probe.

Pre-wired Receptacles (see fig. 1)

These receptacles are already fitted with a component lead which the customer can adapt to the required individual length.

Receptacles for different extension heights (see fig. 3)

As standard, the receptacle is pressed into the carrier material as far as the stop. The receptacle type fitted with a press ring permits different extension heights – it is inserted to a specified distance by means of a special insertion tool. So-called distance rings are an alternative to this and are placed over the receptacle before it is pressed into the carrier material. Distance rings are available for different series and extension heights.

ASSEMBLY HOLES

In order to achieve an optimal fit of the receptacles in the probe location board, the assembly holes must be drilled very carefully. The drill diameters listed in the data sheets for the individual series are the values based on our experience.

These guideline values are dependent on the following conditions:

- » Use of hard metal drills
- » RPM of the drill tool 26.000 ... 35.000 rpm
- » Advance 0.6 ... 0.8 mm/min
- » Material as described in the data sheet
- » Probe location board thickness 10.0 mm
- » Drilling under vacuum swarf removal device

Deviations from these influencing variables may result in other drill diameters.

Trial drillings are recommended in every case.

Fig 1: Standard Types of Receptacles

Fig. 2: Individual Types of Receptacles

Fig. 3: Types of Receptacles for Different Extension Heights

Lateral Play | Quality and Operating Life

LATERAL PLAY

Test Point Accuracy

The test point accuracy which can be achieved is determined by the tolerances in the adapter (play, displacement of the receptacle drill holes), the deviations of the test points and the lateral

play of a fitted spring contact probe (see fig. 1). This occurs as a result of the play between the plunger and receptacle required for the plunger movement and also of manufacturing tolerances (see fig. 2). The amount of lateral play at the plunger tip is also dependent on the length of the plunger in relation to the effective plunger guide length.

Shear forces which deflect the spring contact probe during use also affect the amount of lateral play.

Optimal pinpointing is achieved by a combination of spring contact probes with the shortest possible travel, double plunger guides and minimal adapter tolerance, or even the use of plate guides. Depending on the test probe series which is being used, the test point accuracy – which is dependent on the amount of lateral play – can be reduced to less than 0.8 mm and down to 0.1 mm.

Fig. 1:
Test Point Accuracy (mm)

Fig. 2:
Lateral Play

QUALITY AND OPERATING LIFE

When in use, Test Probes are subjected to high demands in respect of function and operating life. From development to dispatch, the manufacture of PTR test probes takes place in accordance with optimised procedures. A quality assurance system according to EN 29001/ISO 9001 guarantees process security.

Tests are carried out by means of load change tests in order to optimise materials and the constructional design of test probes. Functional capability and operating life are subjected to continuous monitoring in our reliability testing facilities (see fig. 3).

As a rule, the maximum operating life of a test probe depends on the following factors:

- » As low a spring force as possible in relation to the spring diameter and stroke travel
- » Correct axial load, avoidance of shear forces
- » Maintenance of the recommended working travel
- » Precise and gentle insertion of the test probe into the receptacle
- » Avoidance of harmful external influences e.g. soiling, high moisture content of aggressive media, high temperature load
- » Contacting only in current-free or zero-potential state
- » As low a current load as possible

Of course, the level of actual durability also depends on the requirements of each user, e.g. limit values for continuity resistances, degree of soiling, or operating characteristics.

Fig. 3:
Life Circle for Series 1025/E (Example)

We are expanding our product range of interface connectors and adding to our tried-and-tested FKB5322 series with a horizontal variant which permits an orthogonal arrangement of the PCBs. Versions with soldering pins for THT applications, and test probes with a solder connection for individual applications, complete the programme.

The requirement for increasingly smaller centres is met by our new contact block with 1.27 mm / 50 mil spacing in an SMD version.

» Interface Pin Blocks see page 194

TEST PROBES AS PCB COMPONENTS

A new addition to the tried-and-tested 7860 series with exchangeable inner conductor is our 7890 series for the contacting of Fakra-Mini automotive multi-connector systems. Variants for the Fakra plug and jack are available.

- » Product data Mini FAKRA Plug see page 208
- » Product data Mini FAKRA Socket see page 209

HIGH-FREQUENCY TEST PROBES

You can always rely on our comprehensive range of high-current test probes. Our offer covers almost every application requirement from very compact designs for centres of 2.54 mm / 100 mil up to sturdy versions with a rated current of 100 A. Almost all high-current test probes are available in a threaded version which ensures an optimal contact between the test probe and the receptacle. A wide range of different tip styles completes the product range.

» High-Current Test Probes see page 162

TESTING HIGH CURRENTS

Tip Styles

FORM A

90° Concave

For connector pins, wire-wrap pins and straight / curved terminals. To be used under clean conditions because contamination can cause failures.

FORM A6

90° Concave, self-cleaning

For connector pins, wire-wrap pins and straight / curved terminals. The head has special grooves that protect the contact area from contamination.

FORM B

30° pointed tip

For strip conductors, throughplating, soldering points and test pads.

FORM BST

Steel Needle

A sharp steel needle with a long implement life for reliable penetration of flux and dirt on uncleaned printed boards or component groups and for SMD contacts.

FORM BST3

Tri-Needle

Three-needle form of very aggressive character for reliable penetration of flux and dirt on uncleaned printed circuit boards.

FORM C

Serrated

A universal head for straight or curved component leads, wire-wrap posts and connector pins.

FORM CS

Serrated with overlapping plastic insulation

Presence test of component legs. The overlapping plastic insulation avoids electrical contact when connector pins are missing.

FORM D

Round Head

Used to test circuits or gold pads. Do not leave marks on the test area. Also used for testing sockets in connectors.

FORM E

90° Convex

Plated-through holes, pads and lands or sockets in connectors.

FORM EB

Press Fitted Steel Needle

Very aggressive and robust steel needle. Especially designed for testing contaminated areas.

FORM F

Flat head

Especially for gold pads and convex areas, cleaned contact points. Avoids marks on the contact area.

Tip Styles

FORM G

Four-point crown

For component leads, soldering points and test pads, when there is no strong contamination.

FORM H

Pyramid

Plated-through holes and pads. The sharp edges cut through oxides and contaminants.

FORM K

Star

See tip style "H", but with higher contact penetration. Used also for rotating test probes. It cuts through oxides and contaminants.

FORM M

Tulip with overlapping middle edge

The combination of crown and central tip ensures contact reliability at almost all test points. Overlapping middle edge is fixing the head.

FORM M1

Tulip

The combination of crown and central tip ensures contact reliability at almost all test points.

FORM N

Three-point crown - self-cleaning

Designed to test contaminated printed circuit boards. The special cut of the tip allows contaminants to fall out easily.

FORM Q

Four-point crown - self-cleaning

Designed to test contaminated printed circuit boards. The special cut of the tip allows contaminants to fall out easily.

FORM Q8

Eight-point crown - self-cleaning

Designed to test strong contaminated component legs. High centering efficiency.

FORM V

Chisel

Tip with extra penetration of open and closed throughplating, and for level contact surfaces. Penetrates flux and dirt.

FORM D1xxx

Round head

Designed for position test of sockets in connectors.

FORM Y

Spade

application with test probes in connector systems.

TEST PROBES FOR SMALL CENTERS

Test Probes with Centers of 30 mil (0.76 mm) and greater have been designed for applications with very small centers.

In some cases, the diameters are extremely small, and the receptacles for these Test Probes are supplied with pre-assembled wires (AWG 30/AWG 32). The length and colour of the connection wires can be selected as required.

When these Test Probes are used in the test adapters, a guide plate is normally inserted in order to prevent misalignment and damage to the test probe plunger and to optimise the point of contact accuracy.

STANDARD TEST PROBES

CENTER $\leq$ 100 mil / 2.54 mm

The Test Probe series up to 100 mil consist of models with different sizes, travel and extension heights.

This wide range of products allows multi-purpose use such as the testing of assembled components (in-circuit test or function test) or in other applications – wherever a flexible electrical connection is required.

CENTER > 100 mil / 2.54 mm

The range of universal Test Probes for Centers > 100 mil comprises types for centers up to 177 mil / 4.75 mm.

They can be used for ICT/FTs (in-circuit test or function test) of components, burn-in / run-in tests, and for applications up to the testing of connectors on cable harnesses for the automotive industry. The use of suitable probes allows temperature ranges from -30°C up to 250°C to be achieved (see page 14).

ICT-TEST PROBES (E-SERIES)

The range of ICT Test Probes comprises all standard series of products which have established themselves on the market as international standards.

These are test probes for centers from 50 mil to 100 mil with a large selection of different tip styles and contact pressures for almost all test requirements. In addition, test probe units with a longer test probe travel are available for 2-level adaptations. Receptacles with a press ring can be supplied for this series. This press ring can be used as a stop to achieve a constant extension height in the adapter, but it also allows variable heights if the press ring is pressed into a defined setting in the take-up drill hole.

The ICT receptacles are available for various types of connections. In addition to these standards, PTR HARTMANN also offers metric types for the ICT/FT. In this case, the receptacles are normally pressed into the take-up drill hole as far as the stop. Here, too, test probe barrels with different collar heights allow variable extension heights in the adapter.

Component Check in the In-Circuit Test

In-circuit tests are used to recognize faulty installed components as soon as possible. Using defined test points, and on installed PCBs, the electrical data, the correct position and the direction of installation of the individual components are tested. In this way, and in conjunction with a function test, faulty components can be quickly recognized and additional costs avoided on the customer's premises.

HPL TEST PROBES

To ensure reliable contacting of PCBs which are contaminated with residues and or oxidised from the soldering process, a wide range of ICT Test Probes is available from PTR HARTMANN (see page 62).

We are amending our product range with our new HPL (High Pre-Loaded Test Probes), which offer better penetration of contaminants and enable better signal transfer even in Lead-Free applications. A comparison of the spring forces (standard and HPL) is shown in fig. 1.

This HPL-Series will not increase stresses on the UUT/Test Fixture and the same probe travel is maintained as with the standard series.

PTR HARTMANN's HPL Test Probes offer special advantages when used as test contacts for lead-free PCBs. Despite the lack of solder on the test points, the new test probes provide secure contacting and satisfy all the test requirements in this sector.

Fig. 1: Spring Force Charts - Standard Spring to HPL-Series

SERIES	CENTER	PAGE
1008/E (HPL)	50 mil / 1.27 mm	80
1012/E (HPL)	75 mil / 1.91 mm	81
1025/E (HPL)	100 mil / 2.54 mm	82

ROTATING TEST PROBES

Rotating Test Probes offer an alternative
for the testing of assembled components under
unclean conditions.

When the plunger is pressed downwards, its special spiral design causes a rotation, limited to approx. 90°.

This principle allows perfect contacting even when the contact surfaces are dirty or oxidised. In combination with the rotating motion, the tip styles – which are normally aggressive – also allow the use of probes with lower contact pressures.

FLYING PROBES

The Flying Probe testers are designed as a thread variant and are suitable for use in Acculogic (Scorpion) and Digitaltest test systems.

A special locking system and extremely high precision of the single components ensure very high test point accuracy.

TEST PROBES WITH THREAD

Test Probes with Thread are mainly used in the automotive supply industry to test cable harnesses.

The thread on the test probe and receptacle prevents the test probe from gradually twisting out of the receptacle, something which is aided by the spontaneous opening of the test module. Different sizes with centers from 1.27 to 4.0 mm with different tip styles and contact pressures provide a basis for almost all connectors which need testing. A constantly increasing range of Test Probes for position tests completes this range of products.

A large selection of screwing tools and torque screwdrivers makes it easy to use these Test Probes with Thread (see page 228). Test conditions and connectors change very quickly in this sector, so both the market and our customers demand new types of test probes with increasing frequency. Thanks to the use of the most up-to-date control technology in our in-house lathe center, we are able to satisfy these demands. We can manufacture test probes and create special solutions to meet our customers' individual needs promptly and with a high level of precision.

Position Test / Push-back Check

Test Probes for the position test check the correct position of contacting elements in connectors (passive push-back test). In contrast to this, during the active push-back test a high defined force is applied to the contacting elements by means of a push-back test probe. This provides a mechanical check on the locking of the contacting elements in the connector and, in the case of an error, evaluates an electrical interruption. The tips are matched to the relevant connector geometry. PTR HARTMANN offers a wide range of different shapes and dimensions.

Checking for Bent Pins

In order to recognise bent plug pins, special tips are fitted with insulating caps which prevent electrical contact with the tip and generate an error message. The dimensions and shape of the insulation cap and tip plunger are designed to match the geometry of the relevant connector.

Series 1015/G

BENEFIT	
Test probe for cable harness testing	
Test probe geometry for position test	
Screwable - threaded design - against the creeping out of the Test Probe out of the receptacle	
Fast wiring system	
MECHANICAL DATA	
Center	2.54 mm / 100 mil
Temperature Range	-30 °C - +120 °C
Full Travel	4.40 mm
Working Travel	3.50 mm
Pre-Loaded Spring Force	0.25/ 0.40/ 0.40/ 0.30/ 0.70/ 0.60 N
Spring Force at Working Travel	0.70/ 1.00/ 1.50/ 1.70/ 2.50/ 3.00 N
ELECTRICAL DATA	
Max. Current Rating	3.0 A
Typical Continuity Resistance	≤ 30 mOhm

Barrel	Brass, gold-plated
Spring	Spring Steel, gold-plated
Plunger	Steel, gold-plated
Receptacle	Brass, gold-plated
Stranded Wire AWG 20 (Black)	Copper, tin-plated, insulated

HP 2361.1 (Trolitax)	1.68...1.70 mm
HGW 2372 (Glass filled material)	1.68...1.70 mm

Series 1021/G

Test Probe with Thread 100 mil / 2.54 mm

BENEFIT

Test probe for cable harness testing

Screwable - threaded design - against the creeping out of the Test Probe out of the receptacle

MECHANICAL DATA

Center	2.54 mm / 100 mil
Temperature Range	-30 °C - +120 °C
Full Travel	5.30 mm
Working Travel	4.00 mm
Pre-Loaded Spring Force	0.30/ 0.40/ 0.50/ 0.70/ 1.00/ 1.00 N
Spring Force at Working Travel	0.70/ 1.00/ 1.50/ 2.25/ 3.00/ 5.00 N

ELECTRICAL DATA

Max. Current Rating	5.0...8.0 A
Typical Continuity Resistance	≤ 25 mOhm

MATERIALS

Barrel	Brass, gold-plated
Spring	Spring Steel, Stainless Steel, gold-plated
Plunger	Steel, Plastic
Receptacle	Brass, gold-plated
Stranded Wire AWG 20 (Black)	Copper, tin-plated, insulated

RECOMMENDED DIAMETER OF DRILL

HP 2361.1 (Trolitax)	2.00 mm
HGW 2372 (Glass filled material)	2.03 mm

HIGH-TEMPERATURE APPLICATIONS

Temperature Range	-40 °C - +250 °C
Pre-Loaded Spring Force	0.50/ 0.50/ 0.80 N
Spring Force at Working Travel (Order Index E)	1.50/ 2.25/ 3.00 N

NON-ROTATING TEST PROBES

**Non-Rotating Test Probes are always
used for the precisely-positioned contact-creation
of a connector barrel.**

This is normally the case in the testing of flat connectors, as used for example in fuse holders. Contacting then takes place with rectangular so-called spade-shaped tip styles.

Two construction principles are mainly used in order to fix the test probe in position. The purpose of these principles is to create a compulsory guide for the plunger in the test probe barrel. In the simple design, the plunger is guided in the barrel by means of a bolt-groove system. The test probe must be inserted into the receptacle in exactly the right position. If maintenance is needed, the newly-placed test probe must be repositioned.

It is easier to carry out the procedure with a plunger whose end is flattened and has a guide slot at the end of the receptacle. With this principle, the receptacle is placed in position only once. For every new assembly, the test probe is then always returned to the same position via the guide slot of the receptacle.

SWITCHING TEST PROBES

WITHOUT THREAD

Switching Test Probes are primarily used for component checks. To do this, the electric circuit used for signal transfer opens or closes according to a defined switching travel.

For operation, a connection on the receptacle and on the connector pin is normally required. For maintenance work, the use of easy replacement receptacles can save a lot of time because there is no need for rewiring of the connector pin (see page 134). Thanks to our high-precision manufacturing processes, centers of from 4.00 mm to 1.91 mm can be achieved.

Component Check with Switching Test Probes

As a rule, PTR HARTMANN Switching Test Probes operate on the "closer principle". Switching Test Probes can be seen as "axial micro-switches" which, according to a defined switching travel, create an electrically conducting connection between the inner conductor and the outer probe of the Switching Test Probe. "Opener" contacts (NC) are also available for the 3010/2F (see page 130) and 3011/2FGS (see page 145) series.

In addition to a large number of metal tips, PTR HARTMANN also offers versions with insulated tips. These can be supplied as a full-plastic tip and, for improved wear resistance, as a metal tip insulated against the plunger. PTR HARTMANN also offers a so-called "neutral Switching Test Probe" in the version with a plastic tip and hard-wearing protective metal ring.

Applications / Features

- » Check on presence of components or connectors, principally for the cable test, e.g. to check secondary locking
- » Potential-free contacting by means of the above-mentioned insulating tip versions

SWITCHING TEST PROBES

WITH THREAD

Switching Test Probes are available in various designs, from simple plug-in types (see page 122) to threaded types to easy-replacement systems.

Threaded Switching Test Probes are used primarily for cable testing and when a later change to the installation height is necessary (up to 5.0 mm). In these cases, the thread prevents the successive twisting of the Test Probe out of the receptacle. In each case, the electrical connection takes place via a connection to the connector pin of the Switching Test Probe and a connection to the receptacle.

Series 3014/2G and 3024/2G, which have an overall length of only 24.5 mm, are especially compact. As an alternative, both series are available with the easy-replacement system.

Series 3015/G, with its ball-shaped design and a working travel of only 0.8 mm, is especially suitable for applications in which horizontal contacting is necessary.

Switching Test Probes with Easy-Replacement System

The PTR HARTMANN easy-replacement system for switching test probes makes it possible to replace the test probe without releasing the wiring. In this case, the wiring takes place directly on the insulated connection piece of the easy-replacement threaded receptacle which remains in the test module during replacement of the test probe.

The test probe and receptacle are fitted with a matching sprung plug-in system which creates secure, electrical contacting. At the same time, this makes possible faster replacement of the test probe, which contributes to a reduction in servicing times.

PUSH-BACK TEST PROBES

Push-Back Test Probes are used for the contacting of connectors when a “catch test” is necessary.

In this case, a defined high force is applied to the stop parts in order to check correct seating inside the connector or to check that the connector is locked in position. All types are designed as switching test probes. Stop parts which are not locked in position are pushed out by the pressure from the connector, and the push-back test probe does not switch or give a signal.

Push-Back Test Probes are available for centers of 4.0 mm and 2.54 mm and with contact pressures of up to 25 N. Series 5104, 5265 and 3028 are especially effective for these uses. Their modular design gives them a wide range of applications. Of course, solder-free replacement of the test probes is an integral part of the easy-replacement system.

HIGH-CURRENT TEST PROBES

High-Current Test Probes are used when higher currents are involved.

Thanks to their compact design, these series are available for centers of 100 mil (2.54 mm) to 300 mil (7.60 mm) with a large number of different tip styles. Alternatively, all series are available in a threaded type which ensures an excellent fit in the receptacle.

Based on PTR HARTMANN's standard sizes, the high-current types are fitted with a split plunger. During contacting, both parts of the plunger are pressed against each other and, as a result, against the barrel wall. The resulting increased contact with the barrel wall and the overall greater contact surface mean that the test probe can be subjected to higher currents, depending on the series, of 16 A up to 100 A. High-Current Test Probes can be used even when very low and constant resistance values are required.

PNEUMATIC TEST PROBES

Pneumatic Test Probes are operated with compressed air. The plunger presses against the test piece at an operating pressure of 6 bar applied to the test probe via a pneumatic hose. Depending on the size, the maximum contact pressure is up to 1.5 N.

Normally Pneumatic Test Probes are used for function test tasks, and always when measuring points must be triggered individually. A wide range of accessories with distributors, reducers, connection cable glands etc. is available for setting up an extremely large number of contacting processes. As the Pneumatic Test Probes are driven individually/independently, use without complicated test adapters is also possible.

In addition to standard types, there are models with an easy-replacement system and models which function as an opener. With the easy-to-use easy-replacement system, it is only necessary to replace the pneumatic cylinder together with the contacting unit – there is no need to release either the wiring or the pneumatic hose. This system, patented by PTR HARTMANN, considerably reduces set-up and maintenance times.

The opener (4034 series - see page 177) is a technically sophisticated variant, and is also patented. Because of the special design in the barrel, at first it is closed. It is only when a component to be contacted is not present and the switch travel is exceeded that the test probe opens and does not pass on a signal.

BATTERY TEST PROBES

As Battery Test Probes, they are used, for example, wherever it is necessary to charge the rechargeable batteries in mobile devices such as scanners, card readers, communication devices, etc.

In many cases, they are also used to connect two PCBs. In addition to many standard products, PTR HARTMANN specializes in customer-specific solutions.

As a result of our wealth of experience in the connection technology sector, we know exactly what is important in the mounting of PCBs. In addition to complete interface pin blocks (see page 194), of course our products are also available belted and with "pick & place" pads. We develop professional solutions together with our customers, and then implement them precisely.

Selected Applications

- » Mobile process data acquisition devices
- » Medical devices
- » Military devices
- » PCB technology
- » Mobile communication
- » Audio-video applications
- » Data acquisition devices
- » Automotive equipment
- » Heating control units

INTERFACE PIN BLOCKS

Interface Pin Blocks serve the same function as battery probes (see page 180). They can be used as a charging contact in almost all mobile devices, but also for connecting PCBs and as signal conductors, etc.

In such cases, the important advantage is that our standard allows the simultaneous positioning of up to 20 contacts which can be soldered onto the PCB using reflow processes.

As a result of our considerable experience in the manufacturing of injection moulding tools for the connection technology sector, PTR HARTMANN offers complete solutions including plastic carriers, tape-and-reel, and “pick & place” pads, including for individually adapted products. Other types of packing, for example trays, are also available for small quantities and less-automated manufacturing processes. We develop professional solutions together with our customers, and then implement them as scheduled.

The quality of our contacts complies with internationally recognized test scenarios. Our interface pin blocks are approved with UL certification in both the USA and Canada regions.

Series 5322 has passed vibration and shock tests without any measurable contact loss according to the following standards:

- » IEC 60068-2-6, Test Fc: Vibration (sinusoidal)
- » IEC 60068-2-27, Test Ea and guidance: Shock
- » IEC 60512-2-5, Test 2e: Contact disturbance

COAXIAL TEST PROBES

**Coaxial Test Probes – also known as
Kelvin Test Probes – consist
of two independent test probes which
are insulated from each other.**

The inner conductor and outer probe operate and “give” independently of each other. Normally, the current flows via the outer probe, and the voltage drops are measured via the inner conductor.

In addition to a standard type which can be plugged in, we also offer a threaded type which can be screwed 2.0 mm in using a conventional tool (socket head wrench).

HIGH-FREQUENCY TEST PROBES

High-Frequency Test Probes (HF-TP) consist of sprung inner and outer conductors that are arranged coaxially to one another.

This arrangement is optimal for the transmission of high-frequency signals because the electromagnetic field that is required to transport the energy is restricted to the area between the inner and outer conductors. The advantage is that electromagnetic emissions and parasitic induction are effectively suppressed. Specially matched geometric relationships and high precision in manufacture allow the transmission of high-frequency signals with low emissions and losses. For that reason the High-Frequency Test Probes of the 7840 / 7860 series are matched to suit high-frequency systems with an impedance of 50 Ohms. In the same way the geometry and dimensions of the probe heads of the inner and outer conductors are also designed to suit the relevant test piece.

High-Frequency Test Probes are compact, space-saving and solid. As a result they are ideally suited for economically carrying out sensitive measuring tasks involving high-frequencies. Furthermore, their modular construction allows the inner and outer conductors to be changed.

High-Frequency Test Probes are available both in plug-in and screw-type form for use when subjected to disturbing forces that act axially (vibration, impacts and the like). For both types there are matching receptacles that allow fast and secure installation and can be changed easily.

High-Frequency Test Probes have a practical connecting bush for connection to a test system, permitting quick contact creation through standardised MCX miniature plugs, and without soldering or other complicated procedures. These MCX plugs are available ready assembled with a flexible high-frequency cable of the Multiflex type, at the end of which an SMA cable plug, for example, is connected.

FIXTURE CUSTOMIZING

**Interface Pins and Interface Test Probes
for various adapter interfaces are available for
adapter development.**

As a specialist in turned parts, PTR HARTMANN also offers special types for the manufacture of individual interfaces or also counter-contacts for battery applications.

A Marker Probe is available for marking PCBs or similar as correct or defective. This Probe can automatically and extremely quickly mark the required PCBs with a small circle, which ensures that defective parts can be quickly recognized and sorted out.

The Testjet pin is a special pin which is used in adapter development specifically to test HP Testjets or Teradyne Frame Scan applications. The main function of this Test Probe is to keep the pressure on the Testjet sensor plates as low as possible. The springs of the pin adapt the position of the sensor plate to the test piece, which prevents any possible twisting of the plate.

TOOLS AND ACCESSORIES

A wide range of accessories is available for the professional use of PTR HARTMANN test probes.

These include receptacle insertion tools for the ICT test probe range and test probes for use in test modules for cable tests. In addition, we offer screwing tools for our series of test probes with thread, also available as torque screwdrivers. A spring force measuring device, especially suitable for use with the push-back probes needed for the cable test, completes this range. This device makes it possible to carry out the necessary monitoring of contact pressures and their constancy.

Tool Changing WA 834 for Mounting Receptacles

CONTENT

Basic tool WA 834 with standard spring F 834-7.0N-E

Standard spring can be replaced with the stronger spring F 834-14.0N-E

Crimp Tool AFM8

HIGHLIGHTS

4 point crimping
For receptacles
Crimping capacities adjustable

SPECIFICATIONS

Wire Size	0.09 - 0.82 mm ²
AWG	32 - 20
Weight	332,75 g

Torque Screwdriver

TYPE PRESET TORQUE

DMS 1	1 Ncm
DMS 2	2 Ncm
DMS 3	3 Ncm
DMS 4	4 Ncm

Digital Force Gauge FKT50

SPECIFICATIONS

Measuring range	0 ... 50 N
Resolution	0,01 N
Pressure calibration	0,1 Mpa
Load cell	Integrated load cell with M6 connection
Measuring range	1 ... 100 % of the full scale
Measurement accuracy	± 0,5 %
Units	N, kg, lb
Display	LCD
Display Orientation	0° / 180°
Power supply	Internal battery, 12V / 1 A power adapter
Operating temperature	+10 ... +30 °C / 50 ... 86°F
Relative humidity	15 ... 80 % relative humidity
Weight	1 kg / 2.2 lbs
Interface	USB

DIMENSION

Ø A (mm)	Ø B (mm)	CENTER (mm)
2.1	1.6	2.54
2.6	2.1	2.54
3.6	3.1	4.0

FSC® (Forest Stewardship Council®) | Climate neutral

The promotion of an environmentally friendly, socially beneficial and economically viable management of forests — this is the Forest Stewardship Council®'s (FSC®) mission. The FSC's logo must only be used in conjunction with wood products which come from sustainable forest use or which conserve the forest's resources.

In this way, the FSC and its system of certification actively support sustainability when it comes to dealing responsibly with our natural resources.

PTR HARTMANN GmbH supports this mission, and has printed this catalogue in accordance with the guidelines of the FSC directive.

Climate neutral

Carbon neutral printing means compensating for unavoidable carbon dioxide emissions by conserving them in other places when creating print media. The basis for this is an emissions balance which can be tracked in detail for the relevant print medium.

PTR HARTMANN's 2019 "Testing Technology" catalogue has been produced in accordance with this guideline. The ID number can be used to track the emissions balance.

PTR HARTMANN

A Phoenix Mecano Company

A COMPANY IN THE PHOENIX MECANO GROUP

The Phoenix Mecano Group is a technological enterprise which operates around the world and is represented on the international growth markets. With its three building technology, mechanical components and ELCOM / EMS divisions, the company is the leader in many markets. Machinery and plant engineering, measurement and control technology, electrical engineering, automotive and rail engineering, energy technology, medical technology, aerospace technology, as well as the home and hospital care sector, are important fields of application.

GLOBAL PRESENCE

With more than 60 locations on every continent, we and our international workforce are close to our customers and guarantee efficient production, resource-friendly logistics and market-driven solutions.
